COLOR RANGE

When shopping for solar control fabrics, you first need to decide what opacity you're looking for. Our two most popular options are 95 and 90. Fabrics rated 95 will block out 95% of light, only letting 5% in, and 90 fabrics will block out 90% and let in 10%. Fabrics that are less opaque will be better to see through, whereas higher opacities will be more energy efficient.

Light vs. Dark

Many customers gravitate to lighter color shades, thinking that they will be able to see through them better. However, the opposite is true! Since lighter colors reflect light and darker colors absorb light, our black and brown fabrics will have more transparency over our white and cream colors.

HOW IT WORKS

1. Measure

All of our shades are custom made to order, and in order to give the most accurate quote possible we need to take exact measurements of your space. During the measurement, we will also assess what, if any, electrical requirements or other special needs are required for your installation.

2. Order

Once we have correct measurements, we will submit the order to our manufacturers who will custom make your shades. This process usually takes 4-6 weeks, and in the meantime we will keep you informed should there be any complications or details important to your order.

3. Install

As soon as the shades come in, we will give you a call! From there, we will schedule a date to complete the installation. Depending on the number of shades and type, installation times can range anywhere from an hour to several hours. As soon as installation is complete, you're ready to begin using your shades!
